

300mA Linear Regulator With Bypass Pin

FEATURES

- Guarantee 300mA Output Current.
- Fast Response in Line/Load Transient
- Wide Operating Voltage Ranges: 2.0V to 6.0V.
- 0.01 μ A Shutdown Standby Current
- Low Quiescent Current : 80 μ A.
- Output Voltage is available within 1.1~4.2V
- Low Dropout : 270mV at 300mA
- PSRR : 60dB at 1kHz.
- Active High Shutdown Control.
- Fixed: 1.1, 1.2, 1.3, 1.5, 1.8, 2.5, 2.7, 2.8, 2.85, 3.0, 3.3, 3.5, 3.7, 3.8 Output Voltage.Current Limit and Thermal Protection.
- Available in \pm 2% Output Tolerance.
- Available in 3 & 5 lead of SOT-23, TSOT23, SC70, & SOT-89 & DFN 6L 2x2 Package.

APPLICATIONS

- Cellular Phones.
- PCMCIA Cards
- Laptop, Palmtops, Notebook Computers
- Personal Communication Equipment.
- PDAs.
- Digital Still Cameras.
- Portable Consumer Equipments.

DESCRIPTION

AIC1747 is optimized for ceramic capacitor operation with 300mA continuous current. The AIC1747 is designed for portable RF and wireless applications with demanding performance and space requirements.

The AIC1747 offers high precision output voltage of \pm 2% tolerance. Output Voltage is available within 1.1~4.2V. There are version of 1.1, 1.2, 1.3, 1.5, 1.8, 2.5, 2.7, 2.8, 2.85, 3.0, 3.3, 3.5, 3.7, and 3.8 for a fixed output voltage.

A noise bypass pin is available for further reduction of output noise. At 300mA load current, a 270mV dropout can be performed. The quality of low quiescent current and low dropout voltage makes the device ideal for battery power applications. The high ripple rejection and low noise of the AIC1747 provide enhanced performances for critical applications such as cellular phones, and PDAs.

In addition, a logic-level shutdown input is included, which reduce supply current to less than 0.01 μ A (typ.) in shutdown mode with fast turn-on & off time less than 50 μ s & 30 μ s. The AIC1747's current limit and thermal protection provide protection against any overload condition that would cause excessive junction temperatures.

■ BLOCK DIAGRAM

■ PIN DESCRIPTION

VIN - Power supply input pin. Bypass with a 1 μ F capacitor to GND

GND - Ground.

EN - Active High Enable Input.

VOUT - Regulator Output pin. Sources up to 300 mA.

BP - Bypass pin. It should be connected to external 0.1nF capacitor to GND to reduce output noise.

■ DETAILED DESCRIPTION OF TECHNICAL TERMS

DROPOUT VOLTAGE (V_{DROP})

The dropout voltage is defined as the difference between input voltage and output voltage at which point the regulator starts to fall out of regulation. Below this value, the output voltage will fall while the input voltage is reduced. It depends on the load current and junction temperature. The dropout voltage is specified at which the output voltage drops 100mV below the value measured with 1V difference.

LINE REGULATION

Line regulation is the ability of the regulator to maintain a constant output voltage as the input voltage changes. The line regulation is specified as the input voltage is changed from $V_{IN} = V_{OUT} + 1\text{ V}$ to 6 V and $I_{OUT} = 1\text{ mA}$.

LOAD REGULATION

Load regulation is the ability of the regulator to maintain a constant output voltage as the load current changes. To minimize temperature

effects, it is a pulsed measurement with the input voltage set to $V_{IN} = V_{OUT} + 1\text{ V}$. The load regulation is specified under the output current step of 0.1mA to 300mA.

CURRENT LIMIT (I_{IL})

The AIC1747 includes a current limiting, which monitors and controls the maximum output current if the output is shorted to ground. This can protect the device from being damaged.

THERMAL PROTECTION

The thermal sensor protects the device when the junction temperature exceeds $T_J = +150^\circ\text{C}$. It signals, the shutdown logic, turning off the pass transistor and allowing the IC to cool. Thermal protection is designed to protect the device in the event of fault conditions. For continuous operation do not exceed the absolute maximum junction-temperature rating of $T_J = 150^\circ\text{C}$, or damage the device.

■ APPLICATION INFORMATION

INPUT-OUTPUT CAPACITORS

Linear regulators require input and output capacitors to maintain stability. Input capacitor at 1 μ F with 1 μ F output capacitor is recommended.

POWER DISSIPATION

The AIC1747 obtains thermal-limiting circuitry, which is designed to protect the device against overload condition. For continuous load condition, maximum rating of junction temperature must not be exceeded. It is important to pay more attention in thermal resistance. It includes junction to case, junction to ambient. The maximum power dissipation of AIC1747 depends on the thermal resistance of its case and circuit board, the temperature difference between the die junction and ambient air, and the rate of airflow. The rate of temperature rise is greatly affected by the mounting pad configuration on the PCB, the board material, and the ambient temperature. When the IC mounting with good thermal

conductivity is used, the junction temperature will be low even when large power dissipation applies.

The power dissipation across the device is

$$P = I_{OUT} (V_{IN} - V_{OUT}).$$

The maximum power dissipation is:

$$P_{MAX} = \frac{(T_{J-max} - T_A)}{R\theta_{JA}}$$

Where T_{J-max} is the maximum allowable junction temperature (150°C), and T_A is the ambient temperature suitable in application.

As a general rule, the lower temperature is, the better reliability of the device is. So the PCB mounting pad should provide maximum thermal conductivity to maintain low device temperature. GND pin performs a dual function for providing an electrical connection to ground and channeling heat away. Therefore, connecting the GND pin to ground with a large pad or ground plane would increase the power dissipation and reduce the device temperature.
